

Tree Canopy Study Update

NAIP Imagery Sept. 2017

Presented December 18, 2018

SANDY SPRINGS™

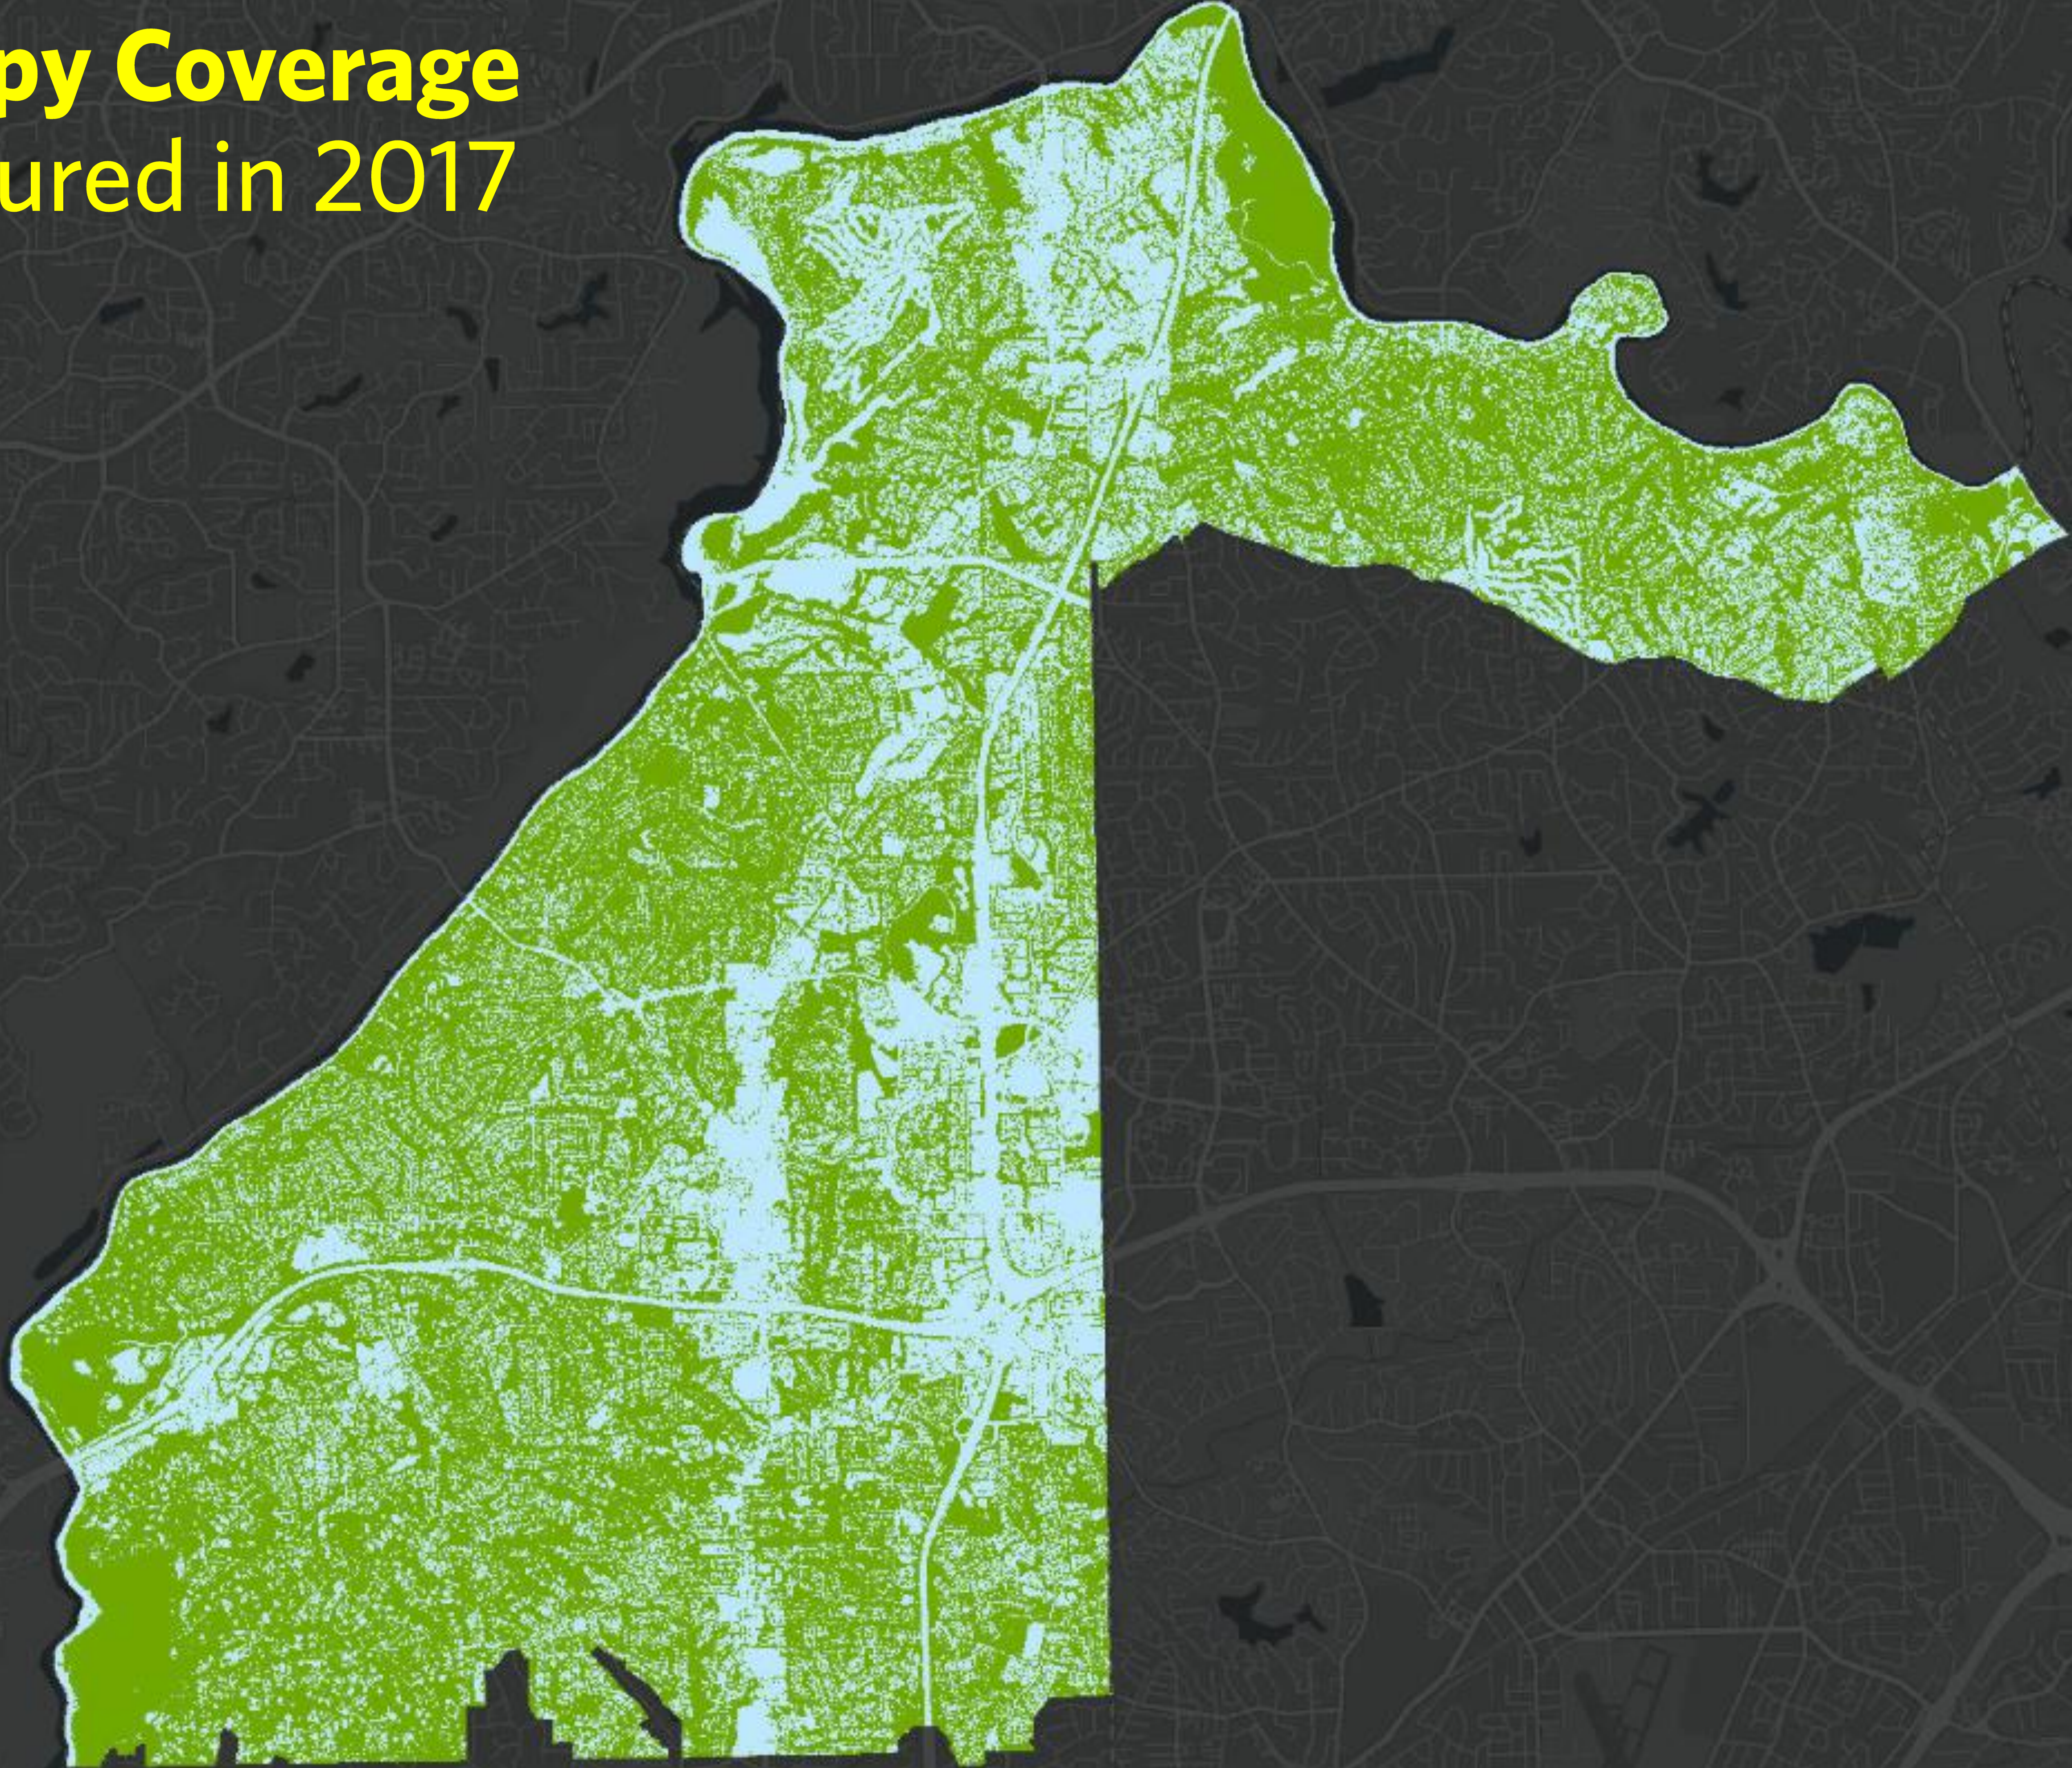

GEORGIA

Map of Canopy Coverage

Imagery captured in 2017

Canopy

Non-canopy

Estimating Area of Canopy

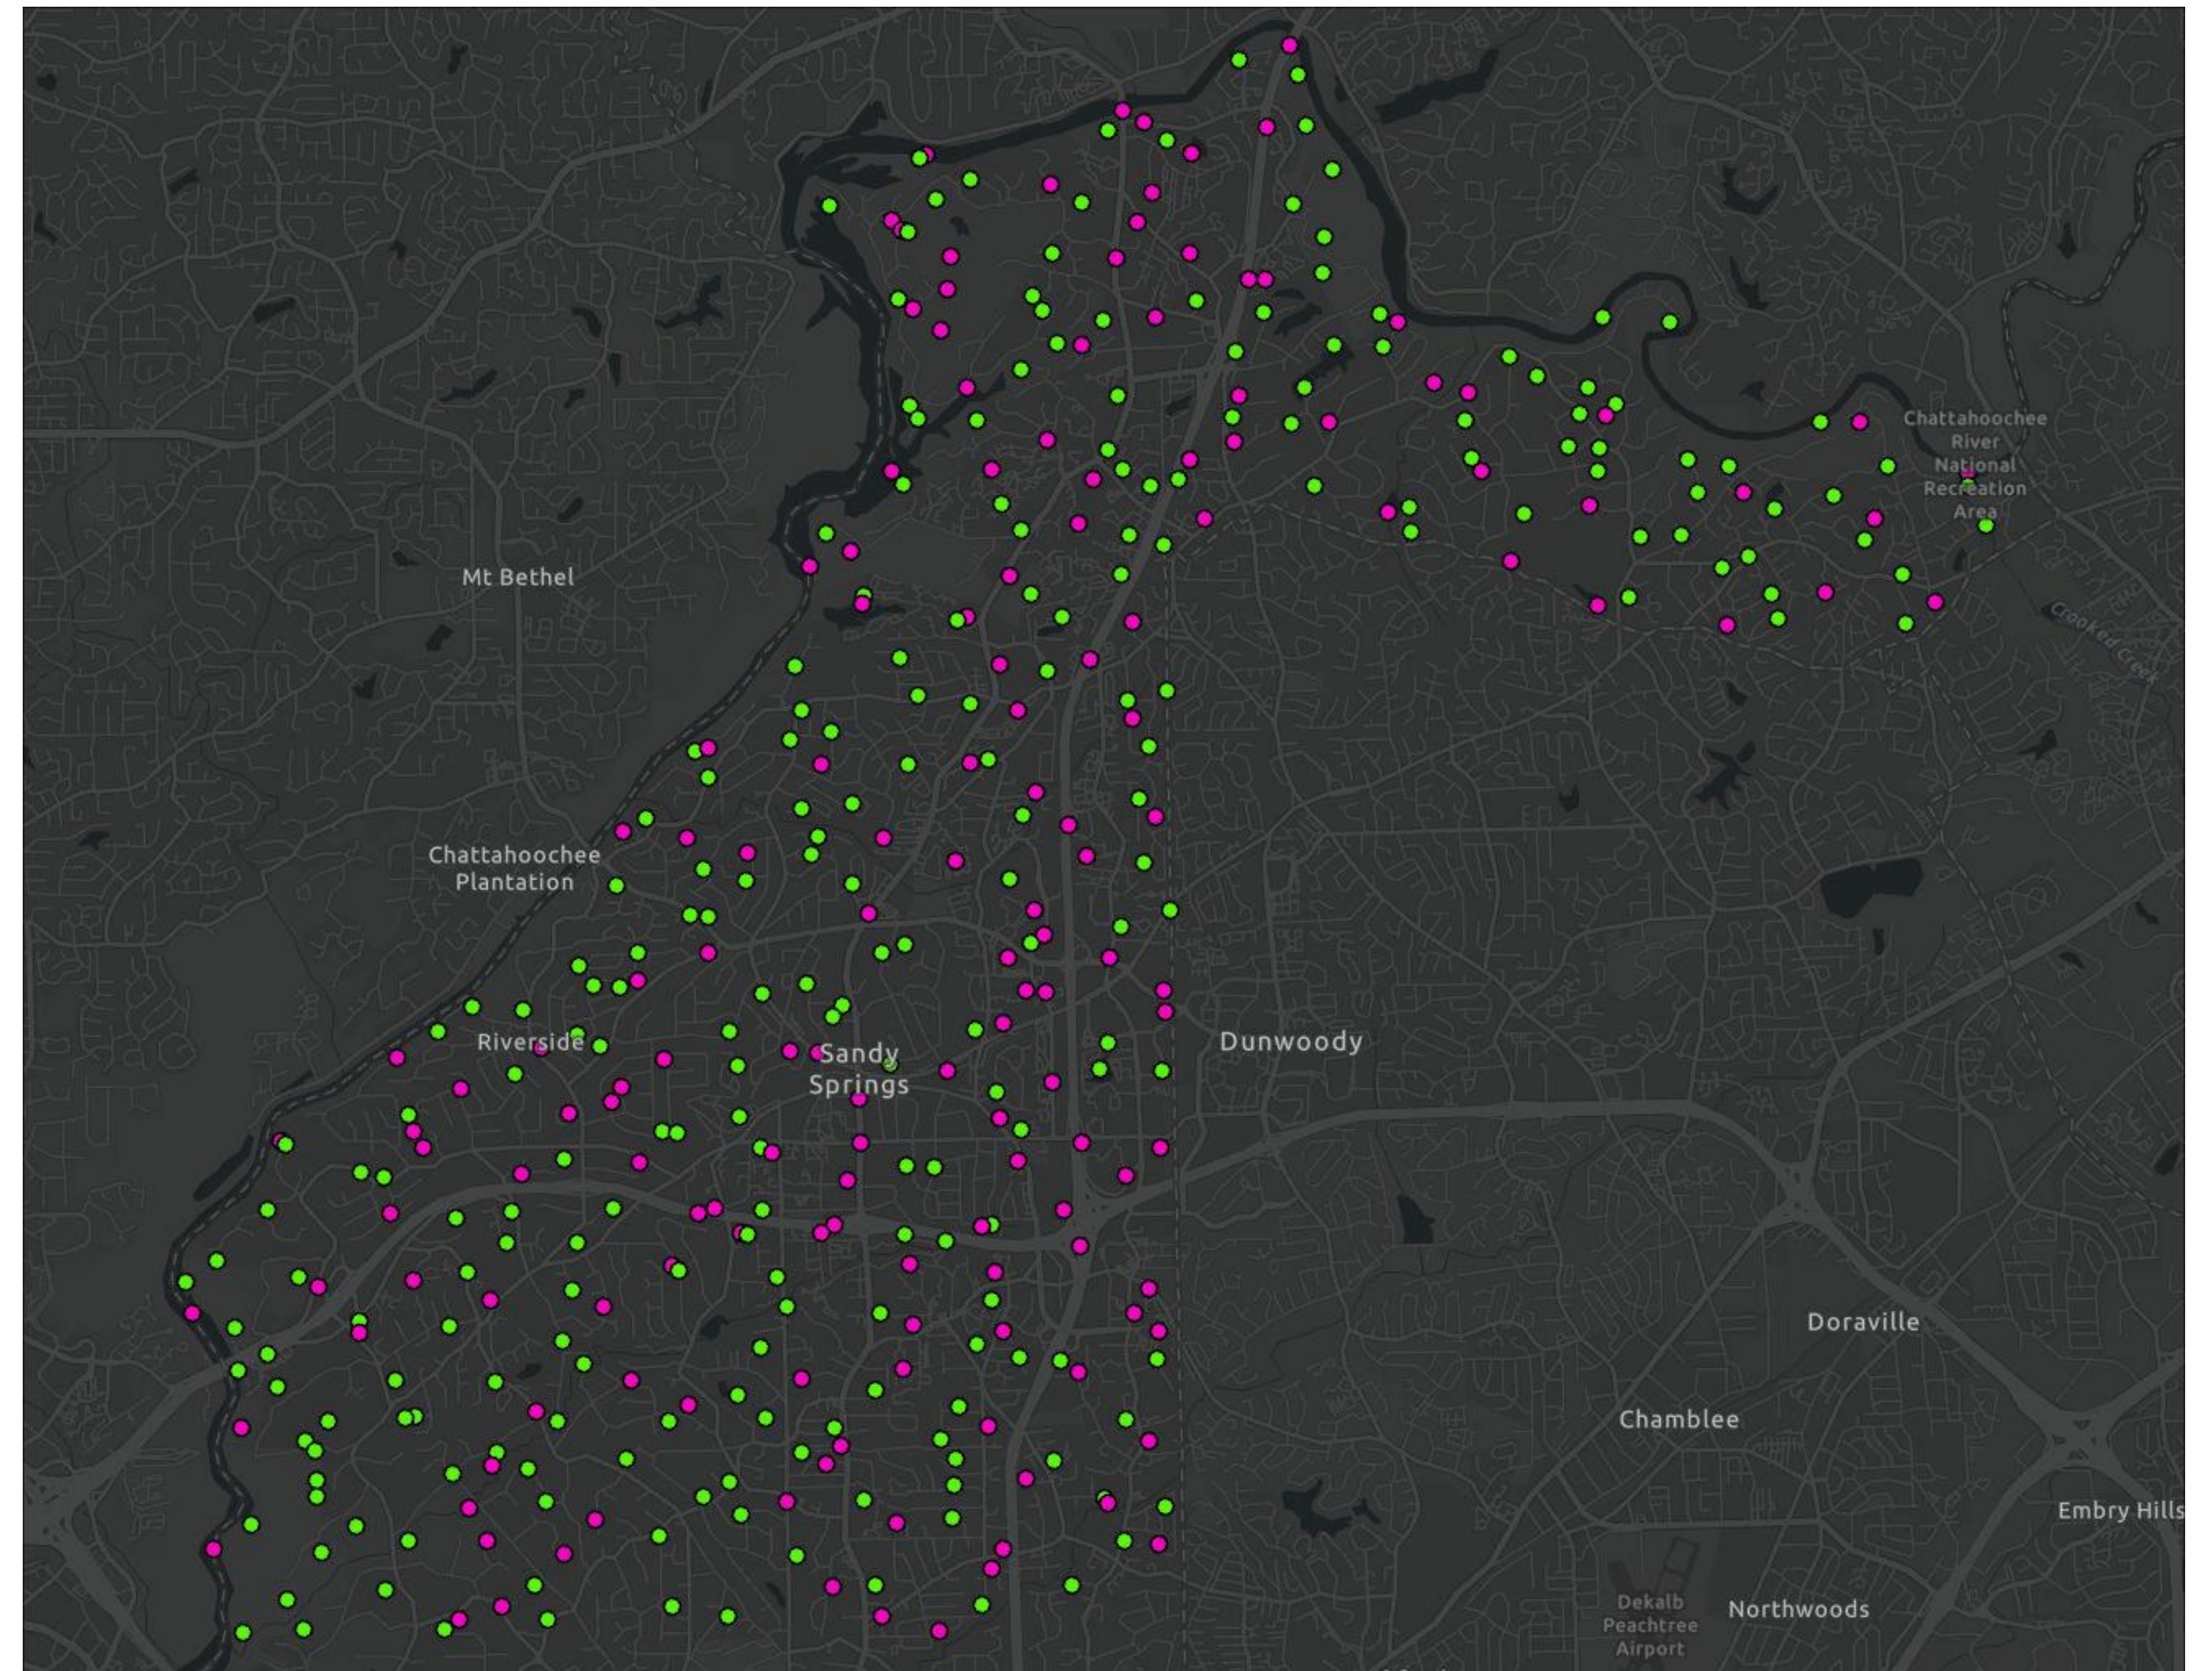

- Using statistical **sampling** instead of the raw map pixel counts
- Conforms to better practices*
 - Manual review of each sampled point is a higher accuracy than automated classifications
 - Reduces bias from the map model
- Advantages
 - Statistical principles can be applied
 - Confidence Level
 - Margin of Error
 - Enables **Accuracy Assessment of the model**

*Tested sample points against manual inspection using stratified random sampling following practices in

- Food and Agriculture Organization (FAO) of the United Nations. 2016. Map Accuracy Assessment and Area Estimation standards: A Practical Guide. National forest monitoring assessment working paper No 46/E. <http://www.fao.org/3/a-i5601e.pdf>
- Olofsson, P., Foody, G. M., Herold, M., Stehman, S. V., Woodcock, C. E., Wulder, M. A. 2014. Good practices for estimating area and assessing accuracy of land change. *Remote Sensing of Environment*, 148:42-57.

Illustration

- 400 sample points
- Stratified random sampling

2017 Canopy Area $\approx 60.3\% \pm 2.6\%$

Estimated Area of Canopy

- We estimate Tree Canopy area in 2017 is about 60.3% \pm 2.6%
 - **We expect the true value to be between 57.7% and 62.9%***
- Tree Canopy Area: 14,978.1 acres \pm 648 acres
- Non-Canopy Area: 9,876.1 \pm 648 acres

2013		2015		2017	
Percent	Margin of Error	Percent	Margin of Error	Percent	Margin of Error
58.7%	\pm3.6%	58.6%	\pm3.1%	60.3%	\pm2.6%

* At the 95% confidence level. We are 95% certain the true value falls within that range.

Accuracy Assessment

- How well did the map perform at the inspected sample points?

- Overall Model Accuracy

2013

2015

2017

83.8%

88.8%

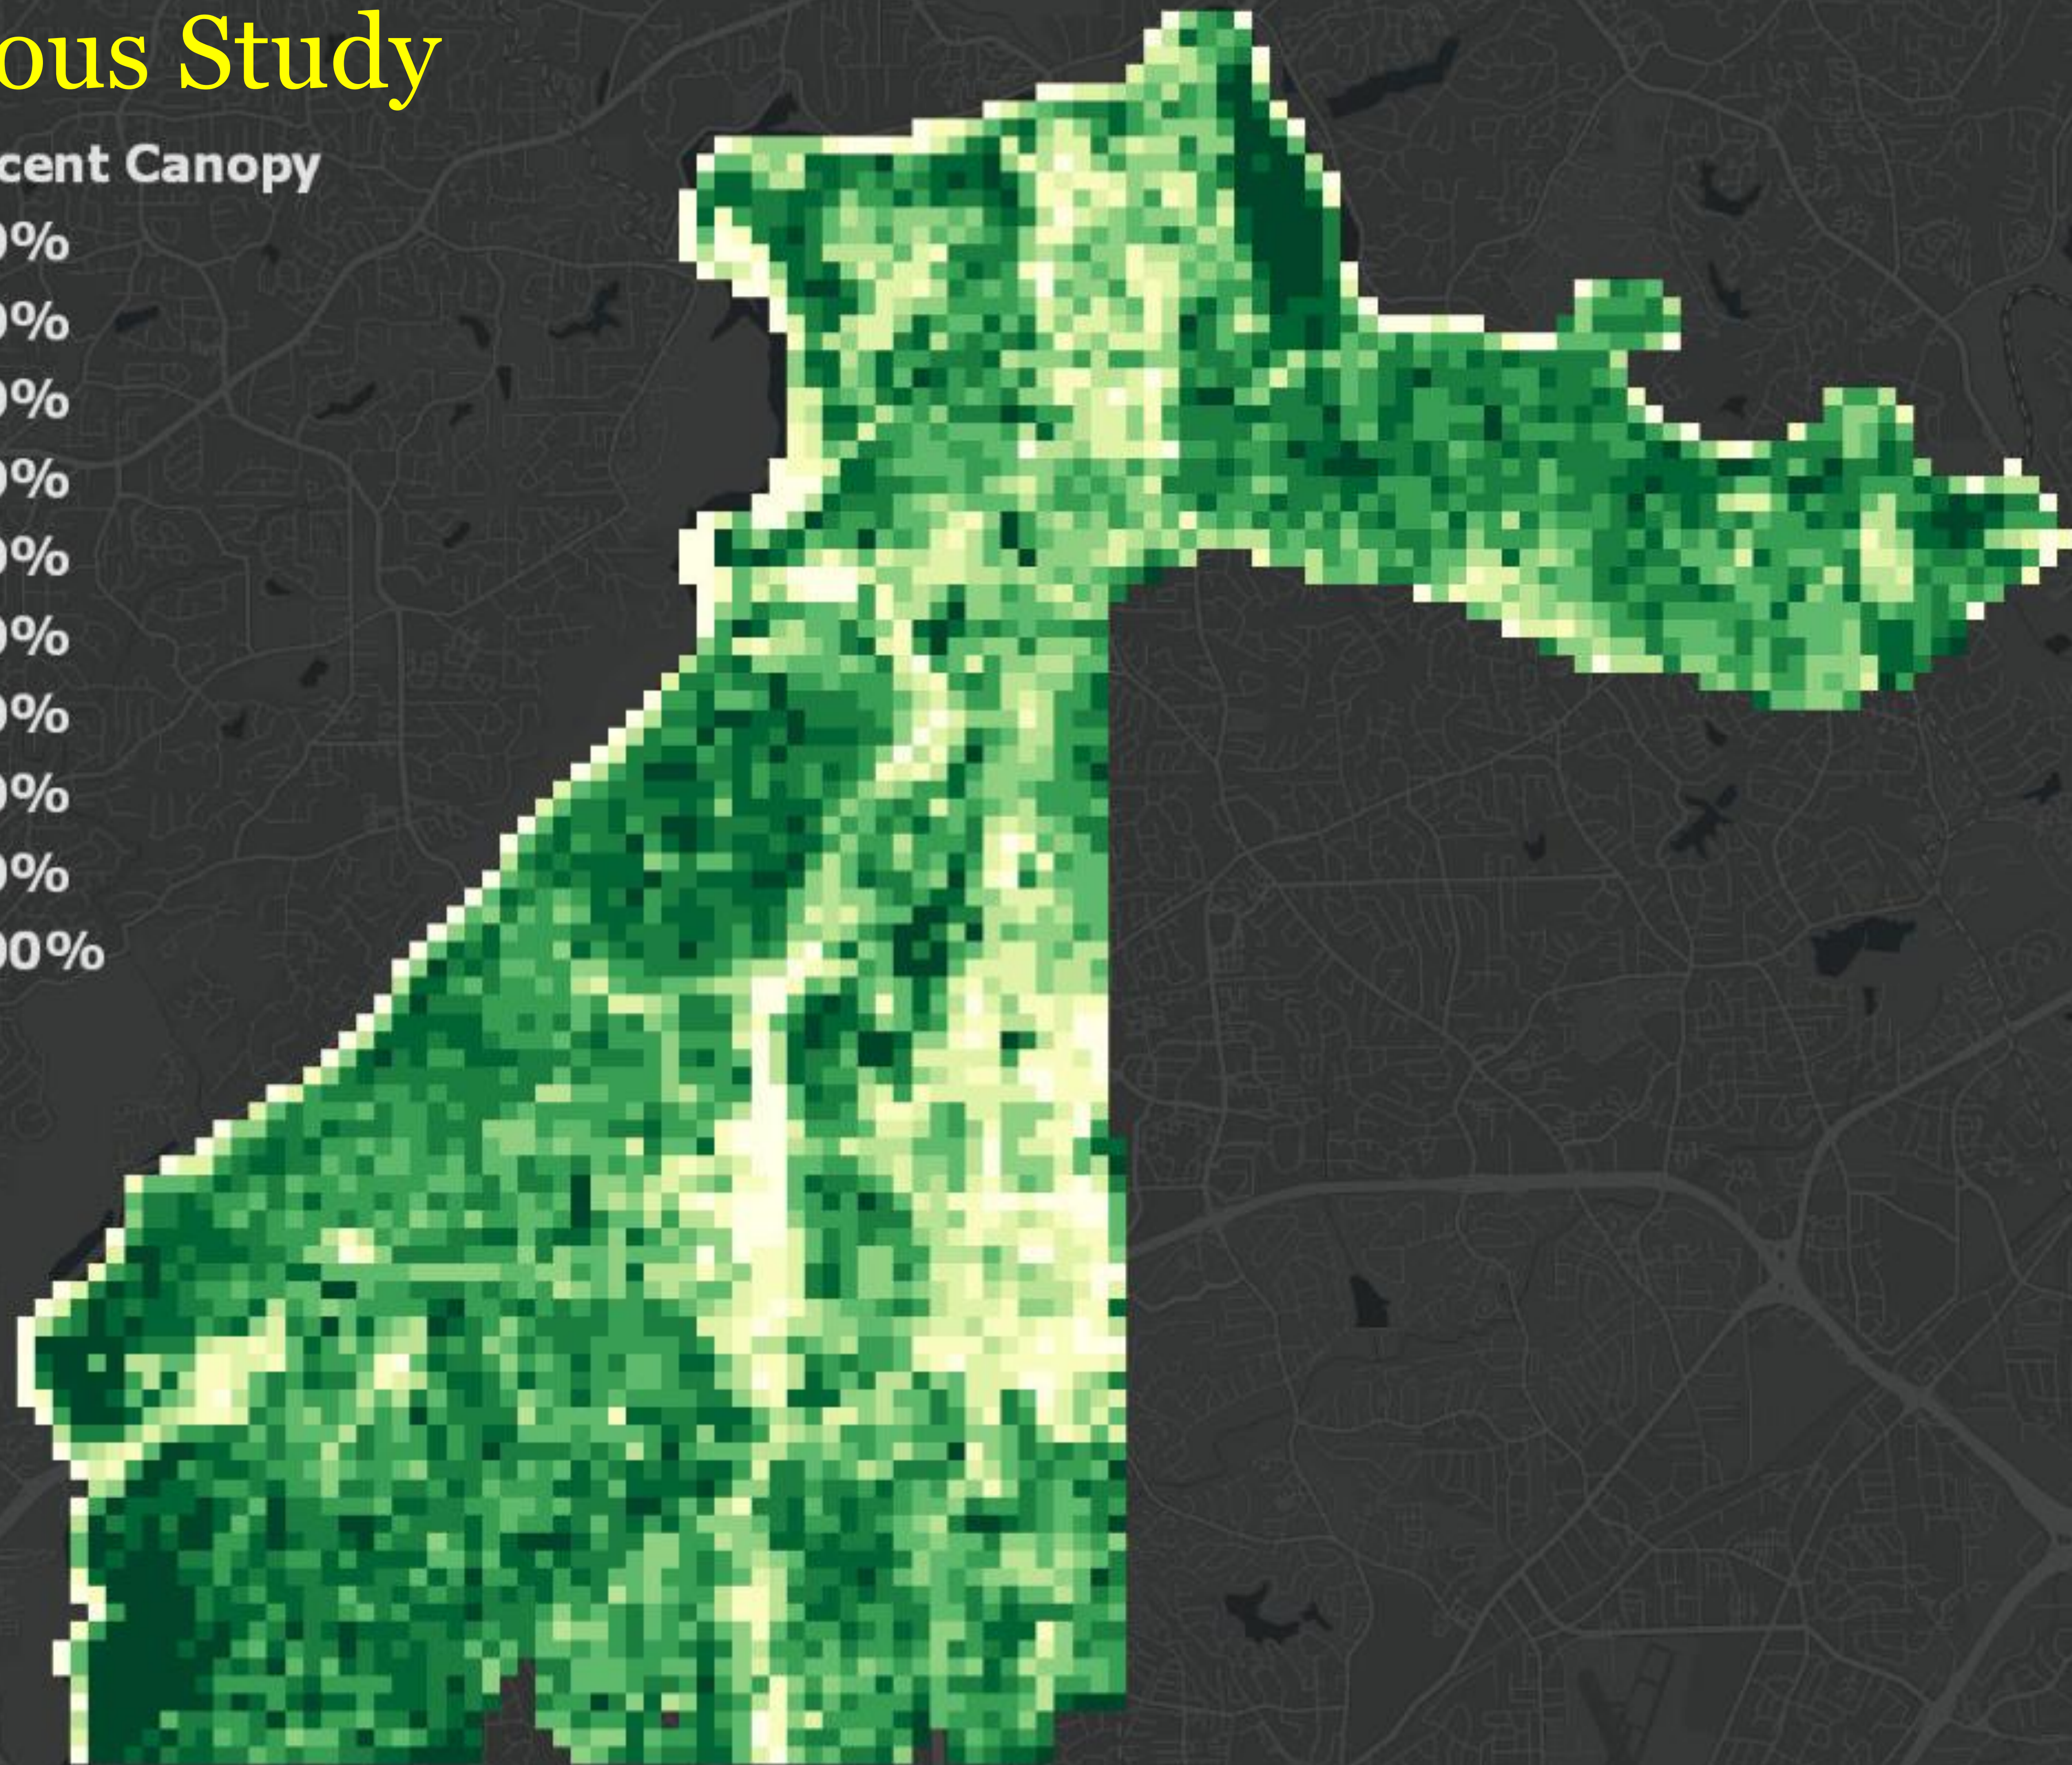

92.3%

- Our methods are improving
 - Reducing errors of omission and commission
 - Smoothing method to reduce “salt & pepper” noise effect

Some noise in change detection exists

- Ex: Correction of shadows from 2015 data resulted in false “canopy loss” in some areas

Conclusion

- Two products are provided:
 - Estimated area of canopy coverage
 - A Map or “GIS Layer” of canopy
- Canopy Change:
 - Change is highly localized
 - Overall canopy estimates year to year are within the margin of error.
 - Estimation at the City-wide level is too large to detect localized change in this time period
- Next steps
 - Summarize data by custom areas, such as zoning districts
 - Utilize data for programs such as targeted tree planting

Thank you
